

What is claimed is:

1. A fixed base assembly of mobile phone, comprising:
a base, having a hollow cylinder extended upward from the center of the top of
said base, a pair of corresponding rectangular through holes being disposed
5 respectively at an extended position of said cylinder and base, such that the
bottom of said base being a hollow, and said hollow and said cylinder being
interconnected, and the top of said cylinder being coupled to a connecting rod,
and one end of said connecting rod being used for clamping a mobile phone;
a sucking disc, having an external diameter slightly larger than or equal to the
10 external diameter of the bottom of said base, and a bar-shaped pillar being
extended upward from the center of said sucking disc, such that said base
being slidably disposed on said sucking disc, and a spring surrounding the
periphery of said bar-shaped pillar, such that said base being capable of sliding
by expanding and contracting up and down along said pillar, and said pillar
15 comprising a through hole along the direction of the diameter;
a clicking member, being coupled to said cylinder and a rectangular through
hole at the extended position of said base, and having a pair of corresponding
arm sections disposed at a pivotal coupling end of said clicking member, and
the other end being a clicking end, and one side of both ends of said two arm
20 sections symmetrically having a circular protruded head section, and a through
hole corresponding to said rectangular through hole being disposed on said two
arm sections, so that a peg being inserted into said through hole of each of said
arm sections, said pair of corresponding rectangular through holes of said
cylinder, and said through hole of said sucking disc pillar, so that said sucking
25 disc pillar, said clicking member, and said base being pivotally coupled.
2. The fixed base assembly of mobile phone of claim 1, wherein said clicking
member at its clicking end comprises a plurality of protruded bars being
disposed equidistant from each other, so that said protruded bars enhance the

friction at said clicking end and prevent said clicking end from slipping off.

3. The fixed base assembly of mobile phone of claim 1, wherein said base is a cone symmetrically along the circumference.
4. The fixed base assembly of mobile phone of claim 1, wherein said connecting
5 rod at another end comprises a clamping base for clamping a mobile phone.
